Proposed Syllabus For B.Tech Program in Materials Science

Newton's laws of motion are three physical laws that, together, laid the foundation for classical mechanics. They describe the relationship between a body and the forces acting upon it, and its motion in response to those forces.

Newton's laws of motion - Wikipedia

To make interacting photons, the team shone a weak laser through a cloud of cold rubidium atoms. Rather than emerging from this cloud separately, the photons within the laser merged bound in groups of three.

Gravity (from Latin gravitas, meaning 'weight'), or gravitation, is a natural phenomenon by which all things with mass or energyâ€”including planets, stars, galaxies, and even light â€”are brought toward (or gravitate toward) one another.

Gravity - Wikipedia

Gravitation is a natural phenomenon by which all objects with mass or energy are attracted toward each other. The attraction between objects can be measured as a force of attraction. In classical physics, gravitation is a force that acts on all masses. In general relativity, gravitation is a curvature of spacetime caused by the uneven distribution of mass. Gravitation is a universal force, attractive only, that exists between all objects having mass. The force of attraction between two bodies is directly proportional to the product of their masses and inversely proportional to the square of the distance between their centers. Gravity is one of the four fundamental interactions in nature. The other three are the electromagnetic interaction, the strong interaction, and the weak interaction. Gravity is the only interaction that acts between all particles, and it is the only interaction that is always attractive. Gravity is the dominant force at large scales, such as in the structure of the universe, the formation of stars and galaxies, and the motion of planets. Gravity is the dominant force at small scales, such as in the motion of objects on Earth. Gravity is the dominant force in the universe, and it is the only force that is always attractive.

Gravitation (gravitation) - Wikipedia

This page or section cites reliable and independent sources, but they do not cover all aspects of the topic, or they compromise verifiability (since May 2016).

Entropy - Wikipedia, the free encyclopedia

Entropy is a concept in thermodynamics and statistical mechanics that is defined as a measure of the disorder or randomness of a system. It is a state function, meaning that its value depends only on the current state of the system, not on the path taken to reach that state. Entropy is a measure of the number of ways a system can be arranged, or the number of microstates that correspond to a given macrostate. The second law of thermodynamics states that the total entropy of an isolated system can never decrease over time. This law is a consequence of the fact that there are many more ways for a system to be in a disordered state than in an ordered state.

Length - Wikipedia, the free encyclopedia

A unit of measurement is a standardized quantity of a determined physical magnitude, defined and adopted by convention or by law. [1] Any value of a physical quantity can be expressed as a multiple of the unit of measurement.

Unit of measurement - Wikipedia, the free encyclopedia

Mass is a concept used in natural sciences. In particular, mass is frequently associated with the weight of objects. This association is not always correct, or when correct, it is not completely elucidating.

Mass - Wikipedia, the free encyclopedia

1. Introduction. The study of the movement experienced by a mass suspended from the free end of a spring is a topic discussed in most introductory physics courses, from both theoretical and experimental outlooks.
